Pasquali P

1. Cryosurgery is a surgical procedure

The photograph shows a collection of surgical instruments and supplies laid out on a blue sterile drape. Visible items include a cryoprobe, several pairs of forceps, a scalpel, and various containers and packaging. The background is dark, making the blue drape and the instruments stand out.

---

---

---

---

---

---

---

---

---

---

---

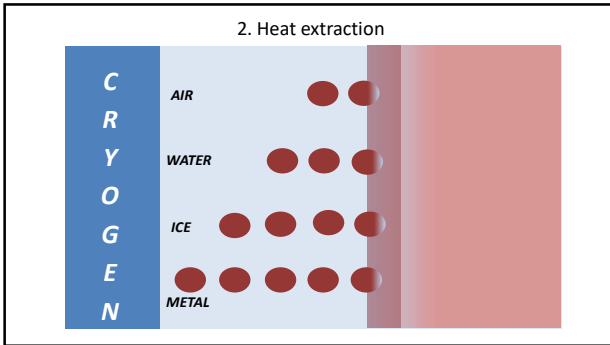

---

---

---

---

---

---

---

---

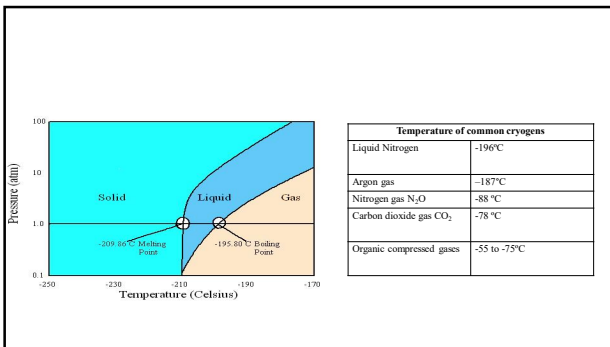

---

---

---

---

---

---

---

---

---

---

---

---

---

4. The temperature decreases from the center out in **isotherm**.

---

---

---

---

---

---

---

---

5. Mechanism of damage

	MECHANISM	TIME of CYCLE	LOCATION
Direct Injury	Extra- and Intracellular ice crystal formation + coagulation necrosis	Freezing phase	Center of the cryoinjury
Vascular Injury	Microcirculatory failure+ Ischemic necrosis	Thawing phase	Periphery of the cryoinjury
Apoptosis	Cell death by apoptosis	Up to 8 hours after rewarming	Periphery of the cryoinjury
Immunological	T-cell response mediated by dendritic cells	Late event	Whole body

---

---

---

---

---

---

---

---

6. Different cells, different sensitivity to cold

**Table 2.3** Sensitivity of tissue and cells to col

Cells/tissues	Lethal tempe
Osteocyte	-2 °C
Melanocyte	-4 °C
Keratinocyte	-35 °C
Adenocarcinoma cells	-40 °C
Sarcoma cells	-60 °C
Endothelium	-15 °C to 40

---

---

---

---

---

---

---

---

### Take Home message

- Cryosurgery is a surgical procedure
- Heat extraction depends on material interposed between tissue and cryogen
- Keratin is a bad conductant
- The temperature decreases from the center out in **isotherm**
- Mechanism of damage
- Different cells, different sensitivity to cold

---

---

---

---

---

**Take Home message**

- Select the best technique for each lesion
- Probes: for vascular lesions and skin cancer
- Probes: the more the better
- Tweezers: grasp exophytic lesions

---

---

---

---

---

---

---

El Gamal E

Over the past 50 years, much experience has been gained in the use of cryosurgery to treat skin lesions.

---

---

---

---

---

---

---

**Most benign skin lesions can be treated successfully with any of several treatment modalities**

- Cosmesis, cost, and patient convenience may make one treatment modality more desirable than another.
- Cryosurgery has advantages over the other modalities.
  - Preparation time is short
  - Treatment requires no expensive supplies
  - Injectable anesthesia.
  - The risk of infection is low, wound care is minimal, and suture removal is not needed.

---

---

---

---

---

---

---

- The margin size depends primarily on the thickness of the lesion
- Margins for most benign lesions can extend as little as 1 to 2 mm beyond the visible pathologic border.

---

---

---

---

---

---

---

---

Recommended Cryosurgical Techniques						
TYPE	TECHNIQUE	FREEZE TIME (SECONDS)*	NUMBER OF FTCS	MARGIN (MM)	NUMBER OF TREATMENT SESSIONS	INTERVAL (WEEKS)†
Actinic keratosis	OS	5	1	1	1	
Cherry angioma	P	10	1	< 1	1	
Common warts	OS	10	1	2	3	4
Cutaneous horn	OS	10 to 15	1	2	1	
Dermatofibroma	F/OS	20 to 30	1	2	2	8
Hypertrophic scar	OS/P	20	1	2	1	
Ingrown toenail‡	OS	20	1	2	2	8
Keloid	OS/P	20 to 30	1	2	3	8
Myxoid cyst	OS/P	20	1	< 1	1	
Oral mucocoele	P	10	1	< 1	1	
Pyogenic granuloma	OS	15	1	< 1	1	
Sebaceous hyperplasia	P	10	1	< 1	3	4
Skin tags	F/OS	5	1	2	1	
Solar lentigo	OS	5	1	< 1	1	

---

---

---

---

---

---

---

---

- A single 20- to 30-second freeze-thaw cycle is advised,
- 1- to 2-mm margin should be obtained.
- Retreatment in eight weeks may be necessary.
- Significant clinical improvement,
  - visible flattening of raised dermatofibromas
  - lightening of pigmentation ( 80-90% px)

---

---

---

---

---

---

---

---

POST OPERATIVE CARE		
Immediate Events	Events after 24-48 hour	Late events
<ul style="list-style-type: none"> <li>• Transient edema</li> <li>• Discomfort/Pain</li> <li>• Evanescent wheals</li> <li>• Edema</li> </ul>	<ul style="list-style-type: none"> <li>• Bulla formation</li> <li>• Exudation</li> </ul>	<ul style="list-style-type: none"> <li>• Mummification/crust formation</li> <li>• Healing</li> <li>• Post-operative redness</li> <li>• Hyper/hypopigmentation</li> <li>• Pseudoepitheliomatous hyperplasia</li> </ul>

---

Cryo pen, CoolLifting, Cryolipolysis

---

---

---

---

---

---

---

---

### CoolLifting

The Cool Lifting gun is a treatment which combines hyaluronic acid and a powerful carbon dioxide flow.

---

---

---

---

---

---

---

### Cryolipolysis

Cryolipolysis is a medical treatment used to destroy fat cells. Its principle relies on controlled cooling to near 4° Celsius (approx. 39° Fahrenheit) for the non-invasive localized reduction of fat deposits in order to reshape body contours.

Nearly 100% of patients who received cryolipolysis developed erythema, oedema and dysaesthesia in the treatment sites  
Discomfort (96%), pain (55%) and bruising (9.5–50%) were commonly observed.

Generally, cryolipolysis result satisfaction was similar to that for RadioFrequency (about 70–100%), and were both overall superior to that of HIFU (high-intensity focused ultrasound), which had multiple reports of satisfaction below 60%.

Because no LLLT (low-level laser therapy) studies which measured satisfaction performed

Kennedy J, Verne S, Griffith R, Falto-Alzpurua L, Nouri K. Non-invasive subcutaneous fat reduction: a review. J Eur Acad Dermatol Venereol. 2015 Sep;29(9):1679-88. doi: 10.1111/jdv.12994. Epub 2015 Feb 9.
